

Exercise 4.7

Page No: 4.119

1. If the sides of a triangle are 3 cm, 4 cm, and 6 cm long, determine whether the triangle is a right-angled triangle.

Solution:

We have,

Sides of triangle as

$$AB = 3 \text{ cm}$$

$$BC = 4 \text{ cm}$$

$$AC = 6 \text{ cm}$$

On finding their squares, we get

$$AB^2 = 3^2 = 9$$

$$BC^2 = 4^2 = 16$$

$$AC^2 = 6^2 = 36$$

Since, $AB^2 + BC^2 \neq AC^2$

So, by converse of Pythagoras theorem the given sides cannot be the sides of a right triangle.

2. The sides of certain triangles are given below. Determine which of them are right triangles.

(i) $a = 7 \text{ cm}$, $b = 24 \text{ cm}$ and $c = 25 \text{ cm}$

(ii) $a = 9 \text{ cm}$, $b = 16 \text{ cm}$ and $c = 18 \text{ cm}$

(iii) $a = 1.6 \text{ cm}$, $b = 3.8 \text{ cm}$ and $c = 4 \text{ cm}$

(iv) $a = 8 \text{ cm}$, $b = 10 \text{ cm}$ and $c = 6 \text{ cm}$

Solutions:

(i) Given,

$$a = 7 \text{ cm}, b = 24 \text{ cm} \text{ and } c = 25 \text{ cm}$$

$$\therefore a^2 = 49, b^2 = 576 \text{ and } c^2 = 625$$

$$\text{Since, } a^2 + b^2 = 49 + 576 = 625 = c^2$$

Then, by converse of Pythagoras theorem

The given sides are of a right triangle.

(ii) Given,

$$a = 9 \text{ cm}, b = 16 \text{ cm} \text{ and } c = 18 \text{ cm}$$

$$\therefore a^2 = 81, b^2 = 256 \text{ and } c^2 = 324$$

$$\text{Since, } a^2 + b^2 = 81 + 256 = 337 \neq c^2$$

Then, by converse of Pythagoras theorem

The given sides cannot be of a right triangle.

(iii) Given,

$$a = 1.6 \text{ cm}, b = 3.8 \text{ cm} \text{ and } C = 4 \text{ cm}$$

$$\therefore a^2 = 2.56, b^2 = 14.44 \text{ and } c^2 = 16$$

$$\text{Since, } a^2 + b^2 = 2.56 + 14.44 = 17 \neq c^2$$

Then, by converse of Pythagoras theorem

The given sides cannot be of a right triangle.

- (iv) Given,
 $a = 8 \text{ cm}$, $b = 10 \text{ cm}$ and $c = 6 \text{ cm}$
 $\therefore a^2 = 64$, $b^2 = 100$ and $c^2 = 36$
 Since, $a^2 + c^2 = 64 + 36 = 100 = b^2$
 Then, by converse of Pythagoras theorem
 The given sides are of a right triangle

3. A man goes 15 metres due west and then 8 metres due north. How far is he from the starting point?

Solution:

Let the starting point of the man be O and final point be A.

In $\triangle ABO$,
 by Pythagoras theorem $AO^2 = AB^2 + BO^2$
 $\Rightarrow AO^2 = 8^2 + 15^2$
 $\Rightarrow AO^2 = 64 + 225 = 289$
 $\Rightarrow AO = \sqrt{289} = 17\text{m}$

\therefore the man is 17m far from the starting point.

4. A ladder 17 m long reaches a window of a building 15 m above the ground. Find the distance of the foot of the ladder from the building.

Solution:

In $\triangle ABC$, by Pythagoras theorem

$$AB^2 + BC^2 = AC^2$$

$$\Rightarrow 15^2 + BC^2 = 17^2$$

$$225 + BC^2 = 17^2$$

$$BC^2 = 289 - 225$$

$$BC^2 = 64$$

$$\therefore BC = 8 \text{ m}$$

Therefore, the distance of the foot of the ladder from building = 8 m

5. Two poles of heights 6 m and 11 m stand on a plane ground. If the distance between their feet is 12 m, find the distance between their tops.

Solution:

Let CD and AB be the poles of height 11m and 6m.

Then, its seen that $CP = 11 - 6 = 5\text{m}$.

From the figure, AP should be 12m (given)

In triangle APC, by applying Pythagoras theorem, we have

$$AP^2 + PC^2 = AC^2$$

$$12^2 + 5^2 = AC^2$$

$$AC^2 = 144 + 25 = 169$$

$$\therefore AC = 13 \text{ (by taking sq. root on both sides)}$$

Thus, the distance between their tops = 13 m.

6. In an isosceles triangle ABC, $AB = AC = 25 \text{ cm}$, $BC = 14 \text{ cm}$. Calculate the altitude from A on BC.

Solution:

Given,

$$\triangle ABC, AB = AC = 25 \text{ cm and } BC = 14.$$

In $\triangle ABD$ and $\triangle ACD$, we see that

$$\angle ADB = \angle ADC$$

[Each = 90°]

$$AB = AC$$

[Given]

$$AD = AD$$

[Common]

Then, $\triangle ABD \cong \triangle ACD$

[By RHS condition]

Thus, $BD = CD = 7$ cm

[By corresponding parts of congruent triangles]

Finally,

In $\triangle ADB$, by Pythagoras theorem

$$AD^2 + BD^2 = AB^2$$

$$\Rightarrow AD^2 + 7^2 = 25^2$$

$$AD^2 = 625 - 49 = 576$$

$$\therefore AD = \sqrt{576} = 24 \text{ cm}$$

7. The foot of a ladder is 6 m away from a wall and its top reaches a window 8 m above the ground. If the ladder is shifted in such a way that its foot is 8 m away from the wall, to what height does its tip reach?

Solution:

Let's assume the length of ladder to be, $AD = BE = x$ m

So, in $\triangle ACD$, by Pythagoras theorem

We have,

$$\begin{aligned} AD^2 &= AC^2 + CD^2 \\ \Rightarrow x^2 &= 8^2 + 6^2 \dots (i) \end{aligned}$$

Also, in $\triangle BCE$, by Pythagoras theorem

$$\begin{aligned} BE^2 &= BC^2 + CE^2 \\ \Rightarrow x^2 &= BC^2 + 8^2 \dots (ii) \end{aligned}$$

Compare (i) and (ii)

$$\begin{aligned} BC^2 + 8^2 &= 8^2 + 6^2 \\ \Rightarrow BC^2 &= 6^2 \\ \Rightarrow BC &= 6 \text{ m} \end{aligned}$$

Therefore, the tip of the ladder reaches to a height of 6m.

8. Two poles of height 9 m and 14 m stand on a plane ground. If the distance between their feet is 12 m, find the distance between their tops.

Solution:

Comparing with the figure, it's given that
 $AC = 14 \text{ m}$, $DC = 12 \text{ m}$ and $ED = BC = 9 \text{ m}$

Construction: Draw $EB \perp AC$

Now,

It's seen that $AB = AC - BC = (14 - 9) = 5 \text{ m}$

And, $EB = DC = 12 \text{ m}$ [distance between their feet]

Thus,

In $\triangle ABE$, by Pythagoras theorem, we have

$$\begin{aligned} AE^2 &= AB^2 + BE^2 \\ AE^2 &= 5^2 + 12^2 \\ AE^2 &= 25 + 144 = 169 \end{aligned}$$

$$\Rightarrow AE = \sqrt{169} = 13 \text{ m}$$

Therefore, the distance between their tops = 13 m

9. Using Pythagoras theorem determine the length of AD in terms of b and c shown in Fig. 4.219

Solution:

We have,

In $\triangle BAC$, by Pythagoras theorem, we have

$$BC^2 = AB^2 + AC^2$$

$$\Rightarrow BC^2 = c^2 + b^2$$

$$\Rightarrow BC = \sqrt{c^2 + b^2}$$

In $\triangle ABD$ and $\triangle CBA$

$$\angle B = \angle B \quad [\text{Common}]$$

$$\angle ADB = \angle BAC \quad [\text{Each } 90^\circ]$$

Then, $\triangle ABD \sim \triangle CBA$ [By AA similarity]

Thus,

$$\frac{AB}{CB} = \frac{AD}{CA} \quad [\text{Corresponding parts of similar triangles are proportional}]$$

$$c / \sqrt{c^2 + b^2} = AD / b$$

$$\therefore AD = bc / \sqrt{c^2 + b^2}$$

10. A triangle has sides 5 cm, 12 cm and 13 cm. Find the length to one decimal place, of the perpendicular from the opposite vertex to the side whose length is 13 cm.

Solution:

From the fig. $AB = 5 \text{ cm}$, $BC = 12 \text{ cm}$ and $AC = 13 \text{ cm}$.

$$\text{Then, } AC^2 = AB^2 + BC^2.$$

$$\Rightarrow (13)^2 = (5)^2 + (12)^2 = 25 + 144 = 169 = 13^2$$

This proves that $\triangle ABC$ is a right triangle, right angled at B.

Let BD be the length of perpendicular from B on AC.

So, area of $\triangle ABC = \frac{(BC \times BA)}{2}$ [Taking BC as the altitude]
 $= \frac{(12 \times 5)}{2}$
 $= 30 \text{ cm}^2$

Also, area of $\triangle ABC = \frac{(AC \times BD)}{2}$ [Taking BD as the altitude]
 $= \frac{(13 \times BD)}{2}$

$\Rightarrow \frac{(13 \times BD)}{2} = 30$
 $BD = \frac{60}{13} = 4.6$ (to one decimal place)

11. ABCD is a square. F is the mid-point of AB. BE is one third of BC. If the area of $\triangle FBE = 108 \text{ cm}^2$, find the length of AC.

Solution:

Given,
 ABCD is a square. And, F is the mid-point of AB.
 BE is one third of BC.
 Area of $\triangle FBE = 108 \text{ cm}^2$
 Required to find: length of AC

Let's assume the sides of the square to be x .

$$\Rightarrow AB = BC = CD = DA = x \text{ cm}$$

And, $AF = FB = x/2 \text{ cm}$

So, $BE = x/3 \text{ cm}$

Now, the area of $\triangle FBE = 1/2 \times BE \times FB$

$$\Rightarrow 108 = (1/2) \times (x/3) \times (x/2)$$

$$\Rightarrow x^2 = 108 \times 2 \times 3 \times 2 = 1296$$

$$\Rightarrow x = \sqrt{1296}$$

[taking square roots of both the sides]

$$\therefore x = 36 \text{ cm}$$

Further in $\triangle ABC$, by Pythagoras theorem, we have

$$AC^2 = AB^2 + BC^2$$

$$\Rightarrow AC^2 = x^2 + x^2 = 2x^2$$

$$\Rightarrow AC^2 = 2 \times (36)^2$$

$$\Rightarrow AC = 36\sqrt{2} = 36 \times 1.414 = 50.904 \text{ cm}$$

Therefore, the length of AC is 50.904 cm.

12. In an isosceles triangle ABC, if $AB = AC = 13 \text{ cm}$ and the altitude from A on BC is 5 cm, find BC .

Solution:

Given,

An isosceles triangle ABC , $AB = AC = 13 \text{ cm}$, $AD = 5 \text{ cm}$

Required to find: BC

In $\triangle ADB$, by using Pythagoras theorem, we have

$$AD^2 + BD^2 = AB^2$$

$$5^2 + BD^2 = 169$$

$$BD^2 = 169 - 25 = 144$$

$$\Rightarrow BD = \sqrt{144} = 12 \text{ cm}$$

Similarly, applying Pythagoras theorem in $\triangle ADC$ we can have,

$$AC^2 = AD^2 + DC^2$$

$$13^2 = 5^2 + DC^2$$

$$\Rightarrow DC = \sqrt{144} = 12 \text{ cm}$$

Thus, $BC = BD + DC = 12 + 12 = 24$ cm

13. In a $\triangle ABC$, $AB = BC = CA = 2a$ and $AD \perp BC$. Prove that

(i) $AD = a\sqrt{3}$ (ii) $\text{Area}(\triangle ABC) = \sqrt{3} a^2$

Solution:

- (i) In $\triangle ABD$ and $\triangle ACD$, we have
 $\angle ADB = \angle ADC = 90^\circ$
 $AB = AC$ [Given]
 $AD = AD$ [Common]
 So, $\triangle ABD \cong \triangle ACD$ [By RHS condition]
 Hence, $BD = CD = a$ [By C.P.C.T]

Now, in $\triangle ABD$, by Pythagoras theorem

$$AD^2 + BD^2 = AB^2$$

$$AD^2 + a^2 = 2a^2$$

$$AD^2 = 2a^2 - a^2 = a^2$$

$$AD = a$$

- (ii) $\text{Area}(\triangle ABC) = \frac{1}{2} \times BC \times AD$
 $= \frac{1}{2} \times (2a) \times (a\sqrt{3})$
 $= \sqrt{3} a^2$

14. The lengths of the diagonals of a rhombus is 24cm and 10cm. Find each side of the rhombus.

Solution:

Let ABCD be a rhombus and AC and BD be the diagonals of ABCD.

So, AC = 24cm and BD = 10cm

We know that diagonals of a rhombus bisect each other at right angle. (Perpendicular to each other)

So,

$AO = OC = 12\text{cm}$ and $BO = OD = 3\text{cm}$

In $\triangle AOB$, by Pythagoras theorem, we have

$$\begin{aligned} AB^2 &= AO^2 + BO^2 \\ &= 12^2 + 3^2 \\ &= 144 + 25 \\ &= 169 \end{aligned}$$

$$\Rightarrow AB = \sqrt{169} = 13\text{cm}$$

Since, the sides of rhombus are all equal.

Therefore, $AB = BC = CD = AD = 13\text{cm}$.
